Tutor Lesson Planning AI Prompt Pack

Plan lessons, quizzes and study guides 5x faster (50+ prompts)

Format: PDF + Notion

Tutors and teachers do not fail because they lack ideas — they fail because the ideas are trapped in a head that also has to mark homework, chase absent students, write parent emails, prep a quiz, and remember what the student covered three weeks ago. This pack turns the work you already know how to do into copy-paste prompts you can fill in, adapt and reuse: 50+ prompts for lesson plans, quizzes, worksheets, homework and progress reports, 10 lesson template structures scaffolded for any subject and level, and differentiation built in so that every prompt adapts to student level, learning style and curriculum. You keep the professional judgement; the AI does the first draft, the formatting, the tiering and the admin.

How to use this pack

1. Fill in the placeholders, then paste. Every prompt in this pack uses `{{double_brace}}` placeholders. Before you paste, replace each one with real detail. If a placeholder is genuinely unknown, write `UNKNOWN` and add a line at the end of the prompt: *"Where I have written UNKNOWN, ask me up to 5 clarifying questions before you begin."* This is the single biggest difference between a useful AI lesson plan and a generic one — detail in, specificity out.

2. Give the AI a role and a standard. The prompts below are written as complete messages: they set the role, the audience, the constraints and the output format. Paste them whole rather than trimming them down. The "Output format" lines are what stop the AI from returning a wall of prose when you need a table, and what stop it from inventing a lesson with no timings.

3. Work in the order that saves the most time. A reliable working sequence for a normal teaching week:

Step	Use this	Time saved
1. Anchor the lesson	Template 1 (standard 50-minute lesson) + Learning Objectives category	20–30 min
2. Build the materials	Activities, Worksheets & Handouts categories	30–45 min
3. Check understanding	Quizzes & Assessment category + exit ticket prompt	15–25 min
4. Set the follow-up	Homework & Follow-up category	5–10 min
5. Communicate	Progress Reports & Parent Communication category	15–20 min
6. Improve next time	Lesson Reflection & Improvement category	5 min

4. Lock your standards with a reusable brief. Most quality problems come from the AI not knowing your curriculum, your exam board, your students' starting points or your house style. Create a one-page *Teaching Brief* (your own template or the starter in the Online & Distance Teaching category) and paste it at the top of any prompt that involves content or assessment. Include: curriculum/exam board, topics already covered, topics still to come, typical class dynamics, what "good" looks like in your studio, and your preferred formatting. Keep it in your Notion page and copy the same block every time.

5. Review, don't publish. AI-generated content will contain plausible errors: an equation that doesn't balance, a historical date that is off by a decade, a question that assesses something you never taught, a "differentiation" that simply makes the task harder rather than more accessible. Use the built-in checks: ask the AI to list every factual claim it made that you should verify, and ask it to flag where a student is likely to make a common misconception. Your professional signature stays on the lesson.

6. Iterate in conversation, not from scratch. When an output is nearly right, don't re-paste the original prompt — give feedback: *"Keep the structure and timings. Make the extension task more open-ended. The reading level is too high for {{level}} — rewrite the extract at a reading age of {{reading_age}}."* Iteration is faster than regeneration and preserves the good parts.

7. Build your own bank. Star the prompts that work for you and keep a personal "my favourites" list in Notion. Swap the subject, level and duration but keep the structure. The pack is designed to be used repeatedly, not once.

A note on levels

This pack refers to UK-style levels (KS3, KS4, GCSE, A-level) because that is where most tutor businesses start, but every prompt works for any system. Where a level is written into a prompt, treat it as a variable:

Level	Typical learner	What "differentiation" means here
KS3 (ages 11–14)	Building foundations, often below expected	Concrete examples, chunked instructions, lots of guided practice
KS4 / GCSE (14–16)	Working toward a grade	Exam command words, mark schemes, timed practice, targeted feedback
A-level (16–19)	Deep conceptual understanding	Second-order reasoning, contradictory evidence, independent research
Undergraduate	Academic study skills	Argument, source evaluation, essay structure, discipline-specific method
Adult beginner	Learning for work, confidence or pleasure	Real-world context, low anxiety, unsanctioned mistakes, pace control
Exam prep (any level)	Time pressure and a target grade	High-frequency practice, error analysis, timed conditions, mock feedback

A note on learning styles

You will see `{{learning_style}}` placeholders throughout. The pack deliberately uses it as a *preference and accessibility* variable (a learner who needs a visual model, a learner who needs step-by-step verbal explanation, a learner who needs hands-on practice, a learner who needs a printed structure to follow) rather than as a rigid "everyone is a visual learner" claim. If you are not sure, use `mixed — adapt by topic rather than by person` and ask for at least two representations of the key idea.

The templates vs the prompts

The **10 lesson template structures** are skeletons — the shape of a lesson, with timings, required sections and decision points already laid out. The **50+ prompts** are the working parts you drop into any skeleton: objectives, activities, quizzes, worksheets, homework, differentiation, parent communication and reflection. In practice you use them together: pick a template, generate the content with the prompts, then edit by hand.

Using this in Notion

Every prompt is a plain text block, so the pack imports cleanly into Notion. A setup that works:

- One page per prompt, with the prompt in a `code` block and your filled-in version in a toggle below it.
- A database of lessons with properties: Subject, Level, Date, Template, Status (Planned / Taught / Reflected).
- A linked database of students with their level, goals, SEN status, home language and next target.
- A view per category, so "what did I write for differentiation this month?" is one click away.

Using this in a PDF reader

The pack is also delivered as a PDF for offline use and printing. Each prompt is self-contained, so you can print the sections you use most — Worksheets & Handouts and Lesson Plan Design are the ones most tutors print.

---

10 Lesson Template Structures — scaffolded for any subject and level

Each template below is a fill-in skeleton: the timings, required sections, decision points and scaffolding are already done. Pick the shape that matches your session, copy it into your notes, and use the prompts in later sections to fill each part. A template is not a lesson — it is the armature on which the prompts build one.

For every template, start by replacing the **Top line** variables, then use the placeholder prompts to generate each marked block. The "Decisions to make yourself" box at the end of each template tells you exactly where your professional judgement must take over — never delegate those to the AI.

Template 1 — Standard 50-minute lesson

Use when: a routine single-topic lesson, any subject, any level. The backbone most tutors teach on; all other templates are variations of this shape.

Top line: Subject: `{{subject}}` | Level: `{{level}}` | Topic: `{{topic}}` | Student/class: `{{student_or_class}}`

Time	Phase	What happens	Generate with
00–05	Do-now / starter	A 5-minute retrieval task that reactivates last lesson's key idea. No new content.	Activity: Starter prompt
05–12	Learning objectives + connect	State what success looks like today (2-3 objectives); link to what the student already knows.	Learning Objectives category
12–30	Teach + model	Present the new idea in one chunk. Model one worked example aloud, showing the thinking.	Lesson Plan Design + Activities
30–40	Guided practice	Student attempts 3-5 similar problems together with you; you scaffold, prompt, correct.	Activities: Guided practice
40–46	Independent practice	Student works alone on 2-3 problems; you observe and note where they stall.	Activities: Independent practice
46–50	Check for understanding	Exit task or 2 quick questions to confirm the objective landed; tell you the plan for next lesson.	Quizzes: Exit ticket

Decision points to make yourself: the one key idea that carries the whole lesson; the precise success criteria; how much the student already knows (don't guess — ask or test); which misconception you expect and how you'll pre-empt it.

Why this timing works: it front-loads retrieval, keeps teaching to one tight chunk, and guarantees the student does more thinking than you do. If you are short on time, never cut the independent practice — cut the teach.

Template 2 — 90-minute workshop

Use when: a longer session, a small group, a higher level, or a topic that needs sustained exploration. Feels different from two 45-minute lessons — it should build momentum rather than double the content.

Top line: Subject: `{{subject}}` | Level: `{{level}}` | Workshop title: `{{workshop_title}}` | Duration: 90 min | Group size: `{{group_size}}`

Time	Phase	What happens	Generate with
00–10	Warm-up + framing	Quick retrieval; set the workshop question; agree the outcome ("by the end you'll be able to...").	Activities: Starter
10–30	Input (one chunk)	20 minutes of teaching max. If the topic genuinely needs more, do it in two 10-minute chunks with a task between.	Lesson Plan Design
30–55	First task	A structured task the whole group attempts; you circulate. Harder than the routine lesson's guided practice — the point is productive struggle.	Activities: Group task
55–70	Critique + refine	Students swap work or you bring up 2 anonymised attempts; the group improves them together.	Activities: Peer feedback
70–83	Extended application	A fresh, slightly harder problem that forces transfer; students work mostly alone.	Activities: Extension task
83–90	Synthesis + close	Whole group: what did we learn, what would you do differently, what's our one question for next time.	Reflection prompts

Decision points to make yourself: the workshop question (make it genuinely debatable or genuinely hard); the "extended application" task — it must be new, not a repeat of the first task; how you will handle the spread of pace across the group.

Why 90 minutes works: you have room for two practice cycles and a genuine critique moment. The workshop's value is in the application and the refinement, not in a longer lecture.

Template 3 — 1-to-1 tutoring session

Use when: a single student, the most common tutoring shape. The structure is the same as a lesson, but the emphasis shifts: the session is a conversation built around the student's specific gaps, not a class.

Top line: Student: `{{student_name}}` | Subject: `{{subject}}` | Level: `{{level}}` | Today's goal: `{{goal}}` | Last session covered: `{{last_session}}`

Time	Phase	What happens	Generate with
00–05	Connect + recall	Check homework, ask what stuck last time. This is diagnostic: what they say shapes the session.	Homework & Follow-up
05–12	Precise target	Agree the one thing we will get better at today. Write it down. In 1-to-1 this agreement is what makes the session feel bespoke.	Learning Objectives
12–30	Teach + go deep	Teach the single idea, but push further than a class would: ask "why", probe the edge cases, let them explain it back.	Lesson Plan Design
30–45	Application	The student works through problems while you watch their process, not just their answer. Pause at the exact moment they hesitate.	Activities
45–55	Consolidation	Student produces a 3-line summary of the rule in their own words; then a problem they

solve alone to prove it. | Quizzes |
| 55–60 | Set next | Agree homework, name the next goal, and decide what to bring next time. Record it for the parent report. | Progress Reports |

Decision points to make yourself: the *actual* gap (a student's stated problem is often not the real one — ask "show me how you did it"); how hard to push the application (1-to-1 is where you can afford to let them struggle productively); what the student should teach you by the end (the ultimate check).

Why this template is different: in a class you aim at the middle; in 1-to-1 you aim at the edge of the student's current ability. The session should feel like it was built for them because it was — cut the padding, go where they are.

Template 4 — Exam revision lesson

Use when: a student is preparing for a specific exam, at any level (GCSE, A-level, undergrad, professional). Revision is a skill in itself — the lesson should teach the strategy as much as the content.

Top line: Exam: `{{exam}}` | Level: `{{level}}` | Paper/unit: `{{paper_or_unit}}` | Topic: `{{topic}}` | Time until exam: `{{weeks_left}}`

Time	Phase	What happens	Generate with
00–08	Diagnose the target	Look at the syllabus or a past paper: what is the highest-yield topic you have not yet mastered? Pick ONE.	Lesson Plan Design + Quizzes
08–18	Technique mini-review	Re-read the core notes for that topic in 10 minutes — but the point is recall, so close the notes and write the key points from memory.	Activities: Retrieval
18–38	Timed exam question	One real past-paper question, timed to exam conditions. State the marks available and the time you have.	Quizzes: Exam-style
38–50	Mark + analyse	Mark it against the mark scheme together. Separate "wrong answer" from "weak technique" (didn't read the command word; didn't show working; ran out of time).	Lesson Reflection
50–60	Fix + record	Fix one specific weakness — a technique, not just the content. Record the error in the student's error log; set a targeted homework.	Homework & Follow-up

Decision points to make yourself: which single topic to target (the highest-yield *unmastered* topic, not the favourite); whether the problem is knowledge or technique — the mark scheme tells you; how to handle the last two weeks before the exam (strategy shifts from learning to consolidating and marking).

Why this template is different: a revision lesson is *not* a teaching lesson with a timer. The output is an error log and a refined technique, not new understanding. If a student needs teaching, you are not in revision mode yet.

Template 5 — Practical / hands-on lab

Use when: science practicals, computing labs, design, art, music, languages (speaking work), any session where the learning happens by doing. The risk is that the doing crowds out the learning — the template keeps the thinking explicit.

Top line: Subject: `{{subject}}` | Practical/task: `{{practical_task}}` | Level: `{{level}}` | Safety/kit notes: `{{safety_kit}}`

Time	Phase	What happens	Generate with
00–08	Brief + safety	State the purpose of the practical, the expected outcome, and the safety/kit rules. In a lab, this is non-negotiable.	Lesson Plan Design
08–18	Pre-lab thinking	BEFORE touching the equipment/software: predict what should happen, write the method in your own words, draw the setup.	Activities: Prediction
18–48	The practical	The doing. You circulate with a checklist, and note students' confidence. Intervene for safety or stuck-ness, not for every error.	Activities
48–55	Results + sense-making	Record results; graph them; write one sentence of conclusion. The data is not the lesson — interpreting it is.	Worksheets
55–60	Link back to theory	Tie the practical to the theory it illustrates. Ask: did it match your prediction? Why/why not?	Reflection

Decision points to make yourself: what the *learning objective* of the practical is (the kit and the fun can obscure it); how much scaffolding the pre-lab thinking needs; the safety briefing content specific to your setting.

Why this template is different: the most common failure in practical lessons is that students do the procedure and learn nothing. The prediction step and the sense-making step are the parts that make it educational — guard them.

Template 6 — Project-based session

Use when: a multi-session project — a research essay, a build, a presentation, a short film, a portfolio piece. This template is for one working session within a longer arc, so it needs the project's overall shape to exist first.

Top line: Project: `{{project}}` | Session number: `{{session_number}}` of `{{total_sessions}}` | Level: `{{level}}` | Student(s): `{{student_or_class}}`

Time	Phase	What happens	Generate with
00–05	Anchor to the project	Where are we in the project, what did we complete last time, what is due at the end. Agree this session's sub-goal.	Lesson Plan Design
05–15	Skills input	One 10-minute chunk of the specific skill this session needs (structuring an argument, citing sources, a tool technique). Teach only what the project needs now.	Activities
15–50	Working block	The project work itself. In a group, roles are assigned; you check in at set points and give feedback on the work, not the person.	Activities: Project work
50–58	Progress check	Student self-reports: what's done, what's stuck, what's next. You record the sticking points for next session.	Progress Reports
58–60	Close + next step	Agree the concrete deliverable for next session and what the student must prepare before it.	Homework & Follow-up

Decision points to make yourself: the project's assessment criteria (what does "done well" mean — write it down at the start); how you will keep the project on track across many sessions; what to do when a student goes off-brief — this is a coaching decision, not an AI one.

Why this template is different: project sessions live in a longer arc, so each session must build on the last and set up the next. The "anchor to the project" phase is what keeps a series of sessions from drifting.

Template 7 — Assessment day

Use when: a full session dedicated to assessing — a mock, a term test, a progress check, or a diagnostic baseline. The line between assessment and teaching should be deliberate: on an assessment day you are collecting evidence, not teaching.

Top line: Assessment: `{{assessment_name}}` | Level: `{{level}}` | Purpose: diagnostic / termly / mock (`{{purpose}}`) | Length: `{{length}}`

Time	Phase	What happens	Generate with
00–05	Set up	Explain the format, the time, the rules, and what will happen with the results. Reduce anxiety, don't add to it.	Lesson Plan Design
05–[end]	The assessment	The student completes it under the agreed conditions. You may observe process (but not interfere). No teaching during the assessment.	Quizzes & Assessment
[end]–+10	Immediate light de-brief	A very light, encouraging "how did that feel" — NO marking in the session. Capture their self-assessment.	Reflection
Later	Marking + analysis	You mark and diagnose separately (see the Analysis prompt in Quizzes & Assessment).	Quizzes: Analysis

Decision points to make yourself: what the *purpose* is (diagnostic vs summative changes what you can conclude); whether to allow notes/calculators (this must be decided before, and written on the paper); how to handle the emotional weight — an assessment a student feels was "awful" is still data.

Why this template is different: the discipline of an assessment day is *not teaching*. If you find yourself explaining a question mid-assessment, you have changed the assessment's meaning. Record the question, mark it afterwards, and teach it next lesson.

Template 8 — Catch-up / remedial session

Use when: a student has a specific gap — missed topics, a shaky foundation, a concept they never quite got. The opposite of the mainline lesson: you are rebuilding, not extending. Nothing here assumes prior knowledge; everything checks it.

Top line: Student: `{{student_name}}` | Subject: `{{subject}}` | The gap: `{{specific_gap}}` | Level: `{{level}}` | What they DO know: `{{prior_knowledge}}`

Time	Phase	What happens	Generate with
00–10	Find the floor	A very small diagnostic (5 targeted questions) to find exactly where the understanding breaks. Is it this topic, or something 3 topics back?	Quizzes: Diagnostic
10–20	Repair the foundation	Teach only the broken piece, at the level below the expected one if needed. Use a concrete example from the student's world.	Lesson Plan Design
20–40	Overlearn	Lots of practice, but at a pace the student can actually keep. Success builds confidence; confidence is the point here.	Activities: Guided practice
40–52	Bridge forward	Now connect the repaired foundation to the topic they were supposed to learn. Show that the old gap is closed.	Activities: Application
52–60	Consolidate + next	A final check that the foundation holds, and a note of what's now possible. Set a confidence-building homework.	Homework & Follow-up

Decision points to make yourself: whether the gap is truly in this topic or upstream of it (test upstream first); the emotional register — remedial sessions are where self-belief is won or lost, pace to success; what "good enough for now" means, so you don't over-teach a foundation that only needed a patch.

Why this template is different: remedial work is not slower mainline teaching; it is targeted repair. The floor-finding step is the most important and the most skipped — never assume the gap is where it appears to be.

Template 9 — Exam-style mock

Use when: a full-length practice exam under timed conditions, usually close to the real exam. This is the highest-stakes template; it is about realism, stamina and calibration.

Top line: Exam: `{{exam}}` | Level: `{{level}}` | Paper: `{{paper}}` | Time available: `{{time}}` | Marks: `{{marks}}`

Time	Phase	What happens	Generate with
00–10	Briefing	Explain exactly what the real exam will feel like, what to do if stuck, and how marks are allocated. No content teaching.	Lesson Plan Design
10–[end of paper]	The mock	Real conditions: timed, closed-book (or as the real exam), no help. You observe technique (watching the clock, skipping and returning, showing working).	Quizzes: Exam-style
[end]–+15	Immediate self-mark	Student marks their own paper against a mark scheme — this is a powerful learning moment that also saves you time. Capture their self-assessment.	Quizzes: Analysis
After	Full mark + diagnostic	Produce the mock report: score, grade, and a ranked list of gaps. The parent report for this is in Progress Reports.	Progress Reports

Decision points to make yourself: choosing the right paper (past paper for the exact board, or your own compiled paper); whether the mock is formative (learning) or summative (a grade) — state it before they sit it; how to frame the result so the student leaves motivated, not crushed — the report does this work.

Why this template is different: the value of a mock is the *experience of the conditions* plus a precise diagnostic, not the score. Never let the score become the headline of the session — the gap list is the headline.

Template 10 — Lesson from a messy source material

Use when: the source material is not a tidy textbook — a long article, a textbook chapter with too much detail, a YouTube video, a podcast, a set of handwritten notes from a missing class, dense slides. The skill here is *curation*: turning messy input into a structured lesson.

Top line: Source: `{{source_type}}` | Topic: `{{topic}}` | Level: `{{level}}` | Student(s): `{{student_or_class}}` | Problem with source: `{{problem}}` (too long / too dense / too advanced / incomplete)

Time	Phase	What happens	Generate with
Before	Curate	Use the "messy source" prompt to extract the 3–5 ideas that matter, the key vocabulary, and the single best example. The AI's job is to carve the lesson out of the source.	Lesson Plan Design: messy source
00–08	Hooking the idea	Start not with the source but with a question the source answers. Give the student a reason to read.	Activities: Starter
08–30	Work the source	The lesson works *through* the source (a guided reading, a structured note-taking, a "why

does this matter" conversation) — you are not teaching the source, the source is teaching the student. | Worksheets |
30–45	Apply	A task that uses the ideas from the source in a fresh context, proving transfer.	Activities: Application
45–55	Synthesise	Student writes a 3-bullet summary of the source in their own words — this is the proof they understood it, not just read it.	Quizzes
55–60	Connect	Link the source to the wider topic and to what comes next.	Reflection

Decision points to make yourself: what to *cut* (the AI can help you see what's in the source, but you decide what the student actually needs); how much of the source the student should read directly vs. your summary — reading stamina is part of the curriculum too; what the "single best example" is — the one that makes the idea click.

Why this template is different: most real lesson planning time is spent here — wrestling with a bad chapter, a rambling video, a dense paper. This template mechanises the curation so you spend your time on the coaching, not the formatting.

Choosing the right template — a quick reference

You are...	Use template
Teaching a routine new topic	1
Running a longer or group session	2
Tutoring one student one-to-one	3
Preparing for a specific exam	4
Teaching something hands-on	5
Running a multi-session project	6
Assessing on purpose	7
Filling a specific gap	8
Running a full mock	9
Wading through messy material	10
# 50+ Prompts for Lesson Plans, Quizzes, Worksheets, Homework and Progress Reports	

Each prompt is self-contained: copy the whole block, fill the `{{placeholders}}`, and paste. Every prompt tells the AI the role, the task, the constraints and the output format. "How to use" tells you when to reach for it and how to judge what comes back.

Lesson Plan Design

Prompt 1. The complete lesson plan from scratch

```
You are an expert classroom teacher and tutor with 15 years of experience in {{subject}} at
{{level}} level.

Write a complete lesson plan for a {{duration}} lesson on {{topic}} for a {{student_or_class}}.
The student's current level in this area is {{current_level}}; their target is {{target_level}}.

The lesson must include:
1. One precise learning objective (what the student will be able to do by the end).
2. A 3-minute "do now" retrieval starter.
3. A teaching chunk (max 12 minutes) with a clear explanation of the key idea and one worked
example.
4. Guided practice with 3-5 problems/tasks, with model answers.
5. Independent practice with 2-3 problems/tasks.
6. A check-for-understanding question.
7. An extension task for fast finishers.
8. A homework prompt the student can complete in {{homework_minutes}} minutes.
9. A "common misconception" note — what the student will probably get wrong and how to pre-empt it.
10. A differentiation note for a student who is {{differentiation_profile}}.

Output format:
- A table with columns: Time | Phase | What the tutor does | What the student does.
- Above the table, the learning objective and success criteria.
- Below the table, the misconception note, the extension and the homework.
- Use plain, direct language. Do not add generic praise or filler.
```

How to use: the workhorse of the pack — use it when you have a topic and nothing else. It produces a full skeleton you then refine. Check the misconception note carefully; it is often the most valuable part.

Prompt 2. Turn a topic into a lesson sequence

```
You are a curriculum designer. I need to teach {{topic}} over {{number_of_lessons}} lessons to a
{{level}} {{student_or_class}} whose current level is {{current_level}}.

Plan the sequence of the {{number_of_lessons}} lessons. For each lesson give:
1. A title.
2. The one learning objective.
3. The "hook" or starter for the lesson.
4. The core activity (1 line).
5. What must be remediated from the previous lesson before moving on.
6. The homework that connects to the next lesson.

The sequence must follow the principle: teach → practice → check → extend, and must build each
lesson on the last. The final lesson in the sequence should assess the whole set of objectives.

Output: a markdown table, one row per lesson, plus one short paragraph explaining the logic of the
order (why this sequence, not another).
```

How to use: for planning a half-term or a multi-week run rather than a single session — e.g. "teach fractions over 6 lessons". The final,paragraph explaining the sequencing logic lets you sanity-check the AI's reasoning.

Prompt 3. Fill one phase of an existing lesson

```
You are an expert tutor. I am planning a {{phase}} for a {{subject}} lesson at {{level}} level.
The topic is {{topic}}; the learning objective is {{objective}}. The student is {{age_profile}} and
learns best via {{learning_style}}.

Generate the {{phase}} content:
- Starter / teach / guided practice / independent practice / plenary / homework (choose one when
you fill this in).

The {{phase}} must:
- Take {{time_allotted}} minutes.
- Match the objective exactly (no tangents).
- Be pitched at {{current_level}}.
- Include concrete, real examples, not abstract ones.
- Provide the answers or a mark scheme.
- Include a 2-line instruction I can say aloud to the student.

Output: the content, ready to use, with a short note on the most likely sticking point for this
student.
```

How to use: when you only need one chunk of a lesson (e.g. the starter or the independent practice), not the whole thing. Faster and more precise than regenerating the full plan.

Prompt 4. Convert a textbook / source into a lesson

```
You are an expert tutor in {{subject}}. Here is a source on {{topic}}:

---SOURCE START---
{{paste_the_source_or_share_a_link}}
---SOURCE END---

I need to teach the key ideas from this source to a {{level}} student in a {{duration}} lesson.
The student's level is {{current_level}} and their main difficulty is {{difficulty}}.

Do the following:
1. Extract the 3-5 essential ideas — the ones a {{level}} student must understand. Ignore the rest.
2. List the key vocabulary terms and give a one-line student-friendly definition for each.
3. Identify the one best example or analogy from the source to anchor the lesson on.
4. Flag anything in the source that is wrong, out of date, or misleading for this level.
5. Build a lesson outline around these essentials with timings, and set a homework task derived
from the source.

If the source is too long for the lesson, tell me what to cut and why.
Output: markdown with clear sections (Essential ideas, Vocabulary, Anchor example, Corrections,
Lesson plan, Homework).
```

How to use: this is the "messy source" template in prompt form — use it for chapters, articles, videos, slides, notes. The correction step is gold: have the AI flag anything dubious before you teach it.

Prompt 5. Lesson plan for a mixed-level group

```
You are an expert tutor teaching a group of {{group_size}} students at slightly different levels in
{{subject}}.
The topic is {{topic}} ({{level}}). The spread of the group is: {{level_descriptions}} (e.g. two
students working at grade 5, one at grade 3, one at grade 7).

Write a {{duration}} lesson plan that:
1. Has ONE shared objective for the whole group.
2. Presents the core idea in a way that works for all levels.
3. Includes a task that the whole group can start together and then branches into three versions:
   - {{support_version}} for the students needing support,-   - {{core_version}} for the middle of
the group.
   - {{extension_version}} for the fast finishers.
4. Includes an exit question that tells you which tier each student will need next lesson.
5. Ends with a 3-line note for how to regroup next lesson based on this lesson's outcomes.

Output: a markdown table (Time | Phase | Whole group | Tiered task | What tutor does), plus the
exit question and the regrouping note.
```

How to use: when you teach a small group where students are not at the same point. The tiered-task step is the difference between a group that drifts and one where everyone learns.

Prompt 6. Design a lesson around a single misconception

```
You are an expert tutor. A {{level}} student in {{subject}} consistently makes this error:
{{description_of_error}}.
The topic is {{topic}}.

Design a {{duration}} lesson whose entire purpose is to repair this misconception.

The lesson must:
1. Start with a short task that deliberately invites the error, so the student confronts it.
2. Use a contrasting-example technique: show two near-identical solutions, one correct and one
containing the error, and have the student find the difference.
3. Provide a clear "rule of thumb" that prevents the error, phrased the way a student would say it.
4. Give 4-6 practice items in which the error is possible (so the " fix is actually exercised).
5. End with a 2-question exit check that confirms the misconception is gone.

Include model answers and a note on what to do if the misconception survives the lesson.
Output: markdown sections: Invite the error / Contrasting examples / Rule of thumb / Practice /
Exit check.
```

How to use: the most surgical use of the pack — when you know exactly what a student gets wrong. This is highly effective because it builds the whole hour around the fix.

Prompt 7. Plan the "shape" of a lesson without knowing the content yet

```
You are an expert lesson designer. I need the STRUCTURE for a {{duration}} lesson on a topic I have not finalised yet, for a {{student_or_class}} at {{level}} level in {{subject}}.

Give me:
1. The recommended phase-by-phase structure with time allocations (starter, teach, practice, check, close).
2. For each phase, the exact questions I should ask myself to fill it in (e.g. for the starter: what did we do last time that today's lesson depends on?).
3. Three suggested "hooks" that work well for this subject and level.
4. A checklist of the 6 things every strong lesson must have (objective, clear instruction, practice, check, extension, homework).
5. The two most common ways this type of lesson fails, and how to prevent them.

Output: a clean, copyable structure I can hang content on later.
```

How to use: use this when you are at the "I have the time and the student but not the lesson" stage — it gives you the skeleton and the questions to ask yourself, so the content half-writes itself.

Learning Objectives & Assessment

Prompt 8. Write precise, measurable learning objectives

```
You are an expert in writing learning objectives. I teach {{subject}} at {{level}} level.

Write {{number}} learning objectives for a lesson on {{topic}}, for a student at {{current_level}} heading to {{target_level}}.

Each objective must:
1. Start with an action verb that is measurable and observable (e.g. "solve", "explain", "compare", "construct", "evaluate" — not "understand" or "know").
2. State the condition (what the student will have available — "without a calculator", "from a source", "in 10 minutes").
3. State the success criterion (how we will know they have it — "to at least 80% accuracy", "using all three sources", "with correct units").
4. Be pitched at the student's current level, not the aspirational level.
5. Include at least one objective at a higher-order thinking level (analyse / evaluate / create).

Then give me a single-sentence "today's outcome" I can say aloud to the student at the start of the lesson.
Output: numbered objectives, then the sentence. No filler.
```

How to use: weak objectives ("understand fractions") produce weak lessons. This forces measurable verbs and success criteria — and the "say aloud" sentence is a genuinely useful habit.

Prompt 9. Turn objectives into success criteria and an exit ticket

```
You are an expert teacher. The objective for my next {{subject}} lesson is {{objective}}
({{level}}).

1. Break this objective into 3-4 observable success criteria, ordered from simplest to hardest.
Each criterion should be checkable in the lesson (a tutor can see or hear it).
2. For each success criterion, write the exact thing I should look for to decide "yes, met" vs "not
yet".
3. Write an exit-ticket question (2 questions maximum) that maps to the success criteria and lets
me judge in under 2 minutes whether the objective landed.
4. Write a short "if they can't do this, then..." guidance — for each criterion, what it implies
for next lesson.

Output: a table with columns Success criterion | What I look for | If not met, next step | plus the
exit ticket questions.
```

How to use: pairs with any lesson. The "if not met, next step" column turns a checklist into a diagnostic that plans your next session.

Prompt 10. Check objectives against the exam specification

```
You are an expert in the {{exam}} specification for {{subject}} at {{level}}.

Here is a set of learning objectives I have drafted for a lesson on {{topic}}:

---OBJECTIVES---
{{paste_your_objectives}}
---OBJECTIVES---

1. For each objective, state whether it matches the specification exactly, is beyond what the exam
requires, or is missing a required element.
2. Map each objective to the relevant specification/syllabus reference and the exam paper it would
be assessed on.
3. Identify any required content for this topic that my objectives do not cover.
4. Reword any objective that does not match the specification language, so it aligns with how the
exam board phrases it.

Output: a table (Objective | Spec match | Spec ref | Paper | Action), then a short list of any
gaps.
```

How to use: exam-board alignment is where tutors earn their fee. Run this over your objectives whenever you plan a revision block, and keep the output in the student's file.

Prompt 11. Write SMART goals for a student's term plan

```
You are a tutor-coach. I work with {{student_info}}, a {{level}} student in {{subject}}. Their
current level is {{current_level}}; their main weakness is {{weakness}}; their target is {{target}}
by {{deadline}}.

Write 3-5 SMART goals for the next {{term_length}} that will move them toward the target. Each goal
must be:
- Specific — one clear outcome.
- Measurable — with a number, test or observable behaviour.
- Achievable — realistic for this student in this time.
- Relevant — directly connected to the target.
- Time-bound — with a date.

For each goal, also give:
1. The weekly actions that will deliver it.
2. How I will measure progress every session (a 2-minute check).
3. The first session's first step.

Output: one short section per goal.
```

How to use: at the start of a term or course. These goals become the spine of your progress reports and your parent conversations throughout the term.

Prompt 12. Pre-test / diagnostic to find the starting level

```
You are an expert tutor in {{subject}}. I am about to start working with a {{student_info}} at
claim level {{assumed_level}}, on the topic area {{topic_area}}.

Write a short diagnostic assessment ({{number_of_questions}} questions) that:
1. Spreads questions across the sub-topics of {{topic_area}} so I can see where the gaps really
are.
2. Ranges from very easy to challenging, so it works even if my assumed level is wrong.
3. Includes 2 questions designed to expose the classic misconceptions in this topic.
4. Includes at least one question that tests underlying pre-requisite knowledge (the things they
need from before this topic).
5. Is scorable in under 5 minutes by me, with a clear mark scheme and an interpretation guide (what
a weak score on each question means).

Output: the assessment questions, the mark scheme, and a one-paragraph interpretation guide.
```

How to use: for the first session with a new student, or before starting a new topic. Resolves guesswork about the starting point — and the interpretation guide tells you what to do about what you find.

Prompt 13. Write a student-facing "today I will learn" blurb

```
You are an expert tutor. Write a short (max 60 words), warm, plain-English "today I will learn"
summary for a {{level}} student in {{subject}}. Today's lesson is on {{topic}}, and we will achieve
{{objective}}.

The blurb should:
1. Tell them what they'll be able to do by the end, in everyday language (no jargon).
2. Tell them why it matters / where it will be useful.
3. Give them one tiny hint of the fun or interesting part.
4. End with one encouraging line that sets the expectation that effort, not talent, is what
matters.

Do not patronise. Write it as a skilled tutor would say it out loud.
Output: the blurb only, ready to paste into the lesson notes or send to the student.
```

How to use: great for motivating students and for sending a pre-lesson message. Also a quick trust-builder with parents when you share the session summary.

Activities & Exercises

Prompt 14. Starter / do-now retrieval activity

```
You are an expert tutor. I need a 5-minute starter for a {{subject}} lesson at {{level}} level. The
topic of today's lesson is {{topic}}; last lesson we covered {{last_topic}}.

Create a do-now activity that:
1. Retrieves the most important idea from {{last_topic}} (the thing today's lesson builds on).
2. Takes 5 minutes and can be done by the student immediately, without my explanation.
3. Has a low threshold (the student can start regardless of confidence) but a high ceiling.
4. Includes the answer, so the student can self-check.
5. Is in a format that works on paper or on screen ({{mode}}).

Make it one of these formats (choose): a 4-question quick quiz / a "spot the error" / a fill-the-
gap / a "what do you remember about X" mind-map prompt.

Output: the activity as the student will see it, then the answers and a 2-line note on common
mistakes.
```

How to use: every lesson's opening. Retrieval is the highest-yield 5 minutes in tutoring; this prompt makes it quick to create.

Prompt 15. Guided practice problem set with scaffolded difficulty

```
You are an expert tutor in {{subject}}. For a lesson on {{topic}} at {{level}} level, I need a
guided practice set for the "I do, we do, you do" model.

Create 5 problems/tasks that:
1. Start at {{starting_difficulty}} and get progressively harder, ending at {{ending_difficulty}}.
2. Cover the key variations of the concept (not just 5 identical problems).
3. Include a fully worked model answer for the FIRST problem (the "I do").
4. For problems 2-3, include a partial scaffold (the first step done, or a hint box) for the "we
do".
5. For problems 4-5, provide only the answer and a mark scheme, for the "you do".
6. Include a hint for each problem that the student can reveal only if stuck.

Output: the problems, with model answers, scaffolds and hints clearly separated and labelled.
```

How to use: this is the core of most lessons. The "I do / we do / you do" split is built in, so you get a ready-made progression rather than a flat list of questions.

Prompt 16. Independent practice set

```
You are an expert tutor. For a {{level}} lesson on {{topic}} in {{subject}}, write an independent practice set the student can complete alone in {{time}} minutes.

The set must:
1. Have {{number}} problems/questions, all directly matching the lesson's objective {{objective}}.
2. Increase in difficulty across the set.
3. Include at least one problem that requires the student to connect this topic to something earlier ({{earlier_topic}}).
4. Include a "challenge" final question that is beyond the objective, optional, and clearly marked.
5. Provide full answers at the end, with brief working.
6. Include a "what to do if stuck" instruction for a student who gets stuck on the third problem (e.g. "re-read the worked example from the lesson, then try problem 2 again").

Output: the set, answers, and the built-in "if stuck" instructions.
```

How to use: the portion of the lesson where the student works alone. The "challenge" final question keeps fast students engaged and gives you an easy extension flag.

Prompt 17. A debate / discussion activity

```
You are an expert tutor. I teach {{subject}} at {{level}} level. I want a debate or structured discussion activity on {{topic}} that runs for {{duration}} minutes.

Create the activity:
1. A debatable statement: {{statement}} (e.g. "The British Empire did more good than harm").
2. Pre-activity: 3-4 "evidence cards" — each with a short fact or position the student can use, so the activity doesn't stall for lack of material.
3. A role/position split for {{number_of_students}} students or for one student arguing both sides (choose based on my setting).
4. Sentence starters for the student to use when presenting ("I agree because...", "A counter-argument is...").
5. A closing task: the student writes a 3-sentence conclusion synthesising both sides.
6. A rubric for how I'll assess the quality of the argument (not the winning side).

Output: statement, evidence cards, roles, sentence starters, closing task, rubric.
```

How to use: humanities, English, history, and higher-level science (ethics, methodology). Great for developing argumentation skills in A-level and GCSE students — and for adult learners in discussion-based classes.

Prompt 18. Retrieval / spaced practice questions

```
You are an expert tutor. I want to build a spaced-practice bank for a {{level}} student in {{subject}}.

I have taught these topics so far: {{topics_taught}} (list them, oldest first). The student's weaknesses are {{weaknesses}}.

Create a {{duration}} retrieval set that:
1. Includes questions from THREE different past topics, not just the most recent (this is the spaced part).
2. Weights more questions toward the weakest topics {{weaknesses}}.
3. Labels each question with the topic it comes from.
4. Mixes question types: recall, application, and one "explain the mistake" question.
5. Provides answers and a short self-marking checklist.

Output: the questions grouped by topic, with answers and the self-check list.
```

How to use: periodically (every 3rd or 4th session) instead of a normal starter. Spaced retrieval is one of the best-evidenced learning techniques, and this makes it trivial to run.

Prompt 19. "Explain like I'm 5" re-teaching task

```
You are an expert tutor in {{subject}}. I want a task where the STUDENT proves they understand
{{topic}} by explaining it simply.

Create an activity where the student explains {{topic}} to a {{audience}} (e.g. a younger sibling,
a friend who missed the class, a grandparent). Provide:

1. The instruction I'll give the student: explain {{topic}} to {{audience}} in plain words, with
one example, in under 2 minutes.
2. A "cheat sheet" of the 3-4 key points the explanation must hit, on the front side.
3. A "what a good explanation sounds like" model transcript (1 short paragraph).
4. A self-check list the student ticks after explaining.
5. The follow-up: what I should look for in the explanation to judge whether they truly understand
(not just parrot).

Output: instruction, cheat sheet, model, self-check, and my assessment note.
```

How to use: the ultimate comprehension check — you can't explain what you don't understand. Use it mid-lesson or as a plenary, especially with younger students and adult beginners.

Prompt 20. A game-based or gamified practice activity

```
You are an expert tutor. I want a fun, gamified way to practise {{topic}} for a {{level}} student
in {{subject}}.

Create a game activity that runs for {{duration}} minutes, using only materials I have (paper,
whiteboard, or a simple digital setup — {{materials}}). Options to choose from:

1. A quiz-show format: rounds of questions with points, "lifelines", and a final "double or
nothing" question.
2. A "Snakes and Ladders"-style board where landing on a square means answering a question.
3. A "beat the clock" challenge: as many correct answers as possible in 3 minutes.
4. A "draft" game: the student picks which problems to attempt from a menu where harder problems
score more.

Provide: the rules, the question bank ({{number_of_questions}} questions with answers), how points
are scored, how I keep it moving, and a note on how to keep the focus on learning rather than just
winning.
```

How to use: perfect for younger learners, exam-revision fatigue, and end-of-term sessions. The question bank is the real content — the game is just the delivery mechanism.

Quizzes & Assessment

Prompt 21. Quick formative quiz (exit ticket)

```
You are an expert tutor. For a {{subject}} lesson at {{level}} on {{topic}}, I need a 3-question
exit ticket that takes under 3 minutes.

Design it so that:
1. Question 1 checks the CORE objective (can they do the main thing we taught?).
2. Question 2 checks the most likely misconception ({{common_misconception}}).
3. Question 3 is a transfer question — a slightly different context that proves they can apply the
idea, not just repeat it.

Each question must be answerable in 30 seconds, with an answer and a marking note telling me what
each wrong answer reveals. End with a "tick one" self-report: 'I could do this confidently /
nearly / not yet'.

Output: the 3 questions, answers, and the interpretation notes.
```

How to use: the end of almost every lesson. The self-report plus the transfer question gives you a 2-minute read on whether the objective landed — and what to do about it.

Prompt 22. Full unit test with mark scheme

```
You are an expert assessor in {{subject}} at {{level}} level. Write a {{duration}} test on
{{topic_area}}, covering the objectives {{objectives}}.

The test must:
1. Have {{number_of_questions}} questions, ordered from easiest to hardest.
2. Include at least one question at each of these levels: recall, application, analysis, and one
extended/essay-style question worth {{extended_marks}} marks.
3. Reflect the exam style of {{exam}} where relevant (command words, mark allocation, question
phrasing).
4. Include a full mark scheme, with clear "award mark if..." guidance for the extended question.
5. Include a grade boundary table (what score = what band) for {{level}}.
6. Include a "common errors" sheet for me — the most likely wrong answers and what they signal.

Output: the test paper, the mark scheme, the grade boundaries, and the common-errors sheet, as
separate clearly-labelled sections.
```

How to use: end-of-topic assessment. Having the common-errors sheet pre-written saves you the diagnostic work and tells you what to plan next.

Prompt 23. Exam-style questions set (with mark scheme)

```
You are an expert examiner for the {{exam}} in {{subject}} at {{level}}. Write
{{number_of_questions}} exam-style questions on {{topic}}, matching the real exam format.

For each question, provide:
1. The question exactly as it would appear in the exam, including the command word (state, explain,
evaluate, calculate, etc.) and the mark allocation.
2. The mark scheme, including the exact credit-worthy points.
3. A "typical wrong answer" and why it scores no marks.
4. The skill being assessed (recall / application / analysis / evaluation).
5. How long a student should spend on it in the exam.

Order the questions by difficulty and include at least one full 6+ mark extended question. Output:
one clean section per question.
```

How to use: exam-prep bread and butter. Give the student past-paper-style questions built around the exact topics they need, with a mark scheme you can mark against and use for feedback.

Prompt 24. Formative assessment / low-stakes check

```
You are an expert tutor. I want a low-stakes, non-graded check for a {{level}} student in
{{subject}} on {{topic}}, so we can find gaps without pressure.

Create a check that:
1. Uses a format that reduces anxiety: e.g. a "traffic lights" self-assessment (green/amber/red)
alongside actual questions, or a "would you rather answer...?" menu.
2. Has 5-6 questions that together cover the whole topic area {{topic_area}}.
3. Lets the student write "I'm not sure" and still feel OK — include a note that this answer is
useful data.
4. Provides a summary chart I can fill in: for each question, whether the student was green
(confident + correct), amber (unsure or partially correct) or red (wrong / skipped).

Output: the check, the answers, and the summary chart with interpretation notes for each colour.
```

How to use: for diagnostic sessions, for nervous students, or pre-mock. It surfaces gaps without the emotional weight of a scored test, and the traffic-light summary feeds straight into your planning.

Prompt 25. Multiple-choice quiz with distractors designed around misconceptions

```
You are an expert test-writer in {{subject}} at {{level}}. Write a {{number_of_questions}}-question
multiple-choice quiz on {{topic}}.

For each question:
1. The stem must be clear and unambigious, and the correct answer must be genuinely correct.
2. The distractors must be PLausIBLE — they should be common mistakes, misconceptions, or partial
understanding, not obviously wrong fillers.
3. After the correct answer, note the specific misconception each distractor represents (e.g.
"Option B is the answer students give when they forget to invert the fraction").
4. Include a brief explanation of the correct answer I can show the student after they answer.

Output: the quiz in a copyable format, then an answer key with the misconception notes and
explanations.
```

How to use: the distractor-as-misconception design turns a quiz into a diagnostic. When a student picks option B, you instantly know the error in their thinking — much more useful than a correct/incorrect mark.

Prompt 26. Analyse a student's mistakes and diagnosis the gaps

```
You are an expert tutor-diagnostician. Here is a set of a student's answers from a recent
assessment on {{topic}}:

---ANSWERS---
{{paste_the_students_answers_or_photo_description}}
---ANSWERS---

Analyse them and:
1. Sort the errors into categories: knowledge gaps / technique errors (misread the question, didn't
show working) / careless slips / time-management issues.
2. For each category, list exactly which questions show it and the pattern you see.
3. Identify the SINGLE most impactful thing to work on next — the fix that would have recovered the
most marks.
4. Write a 3-bullet summary for the student in plain language, framed positively (what went well
first, then the one thing to improve).
5. Write a 3-line note for the parent or for me that says what the next phase of work will be.

Output: the categorised error table, the #1 priority, the student summary, and the parent note.
```

How to use: after any assessment or mock. This is the analytical engine of the pack — it turns a scored test into a road map. Verify the AI's reading of specific questions against the real mark scheme.

Worksheets & Handouts

Prompt 27. A worksheet with a clear structure and answer key

```
You are an expert worksheet designer for {{subject}} at {{level}}. Design a worksheet on {{topic}}
for a {{duration}} task.

The worksheet must have:
1. A header with the topic, the objective, and a space for the name/date.
2. Three sections, clearly labelled, increasing in difficulty:
   - Section A: Recall and warm-up ({{number_a}} questions)
   - Section B: Core practice ({{number_b}} questions)
   - Section C: Challenge / stretch ({{number_c}} questions)
3. Clear, readable layout — numbered questions, space to show working, and a "hint" box on the
harder questions.
4. A "check your work" box at the end with the key answers, so the student can self-mark.
5. A teacher answer key, separate, with full working.

Do not make it cluttered. Keep questions on the page consistent with the level. Output: the student
worksheet, then the answer key.
```

How to use: the standard worksheet. The built-in self-check box means the student can mark their own work before you see it, which improves learning and saves you time.

Prompt 28. Scaffolded worksheet for a struggling student

```
You are an expert SEN-aware worksheet designer for {{subject}} at {{level}}. Create a worksheet on
{{topic}} for a student who struggles with {{difficulty}} (e.g. reading load, processing speed,
anxiety, language barriers).

Design it so that:
1. Instructions are short, numbered, and use simple plain English (reading age ~{{reading_age}}).
2. Each section starts with a worked example showing the method before the student tries it (the
"show me one, then you do one" model).
3. Bigger spacing, clear boxes for answers, and no multi-step compound instructions.
4. The task is identical in objective to the class worksheet but chunked into smaller steps with
more scaffolding.
5. It includes one "I'm stuck" prompt — a clear instruction on what to do when a question is too
hard (move on, star it, ask me).
6. It ends with a positive, effort-focused note.

Output: the worksheet, then a 3-line note for me on how to adapt it further if the student still
struggles.
```

How to use: when a student needs more support. The "show me one, then you do one" format is accessible, and the chunking keeps the same content within reach.

Prompt 29. A one-page revision summary / crib sheet

```
You are an expert summary-writer for {{subject}} at {{level}}. Create a ONE-PAGE revision crib
sheet for {{topic}} that fits on a single page (can be printed on one side of A4).

Include only what a student needs for revision:
1. The 5-8 key facts / formulas / definitions for this topic.
2. A micro-example for each that shows it in use.
3. The 2-3 most common mistakes in this topic and their corrections.
4. A "command words" note for {{exam}} — how the topic tends to be asked and which command words
appear.
5. A tiny "quick check" box with 3 one-line questions to self-test.

Format it densely but readable: use short lines, minimal prose, and clear visual hierarchy. Do not
exceed one page.
```

How to use: the most-printed artifact in the pack. Give it to students before an exam or at the end of a topic. You might never mark it — but it will be the thing they actually reread.

Prompt 30. A fill-in-the-blanks / cloze handout

```
You are an expert worksheet designer for {{subject}} at {{level}}. Create a cloze (fill-in-the-
blanks) handout on {{topic}}.

Requirements:
1. A short paragraph ({{word_count}} words) of connected text about the topic, with
{{number_of_blanks}} blanks.
2. The blanks must target the KEY terms and concepts — not trivial words.
3. Provide a word bank at the top with the correct words jumbled, plus 2 extra distractor words.
4. After the passage, add 2 short comprehension questions that require using the filled-in terms.
5. Provide an answer key with the correct fill-ins and brief explanations.

Make the passage genuinely informative, not padded. Output: the student handout, then the answer
key.
```

How to use: good for vocabulary-heavy subjects (history, biology, languages, English terminology) and for settling students into a topic. Works well as a starter or as homework.

Prompt 31. A data / graph / diagram worksheet

```
You are an expert worksheet designer for {{subject}} at {{level}}. Create a worksheet based on
{{data_type}} (e.g. a graph, table, chart, diagram, map, or dataset) that I will supply.

Here is the data/source:

---DATA---
{{paste_the_data_or_describe_the_diagram}}
---DATA---

Build a worksheet that:
1. Asks {{number}} questions that move from simple reading (what's the value/trend) to
interpretation (what does it mean, why might it be so) to evaluation (what is the limitation, what
would change it).
2. Includes one question requiring the student to draw/extend the graph or diagram.
3. Includes an answer key with model interpretations.

Output: the worksheet, then the answer key with clear model answers.
```

How to use: for science, geography, economics, statistics and history (source analysis). The progression from reading to interpreting to evaluating mirrors how exams ask about data.

Homework & Follow-up

Prompt 32. A homework task that consolidates the lesson

```
You are an expert tutor. I just taught a {{subject}} lesson on {{topic}} at {{level}} level. Design
a homework task that:
1. Takes {{minutes}} minutes (not longer).
2. Directly consolidates today's objective {{objective}} — it must re-exercise the same skill.
3. Includes one retrieval question from a PAST topic ({{earlier_topic}}).
4. Includes one question that prepares for NEXT lesson ({{next_topic}}) — a gentle pre-exposure.
5. Is self-checkable, with answers provided at the end so the student can mark it before the next
session.
6. Comes with a 1-line instruction I can paste to the student in chat.

Output: the homework, the answers, and the chat-ready instruction line.
```

How to use: the standard homework. The "past + present + future" mix is the key design choice — it does three jobs in one task.

Prompt 33. Homework set for a multi-lesson project

```
You are an expert tutor. My {{level}} student in {{subject}} is working on a multi-session project: {{project_description}}.

We have completed session {{session_number}} of {{total_sessions}}. Set the homework that moves the project forward in the gap between sessions.

The homework must:
1. Be specific and achievable in {{minutes}} minutes, with a clear deliverable (e.g. "complete the outline", "find 3 sources", "record the first draft").
2. Require the student to DO something, not just read.
3. Include a "show your work" element — something they bring back that lets me see both the product and the process.
4. Include a 1-line progress question the student answers on return (e.g. "what was the hardest part?").
5. Explicitly state what we will do with it at the start of next session.

Output: the deliverable, the progress question, and the next-session plan note.
```

How to use: for project-based sessions (Template 6) and any multi-week arc. It keeps projects alive between sessions and gives you material to start the next session with.

Prompt 34. A homework that targets a specific weakness

```
You are an expert tutor. A {{level}} student in {{subject}} is weak at {{specific_weakness}} (e.g. solving simultaneous equations, writing conclusions, pronunciation of certain sounds).

Set a focused homework that:
1. Contains {{number}} problems/tasks, ALL targeting this weakness, and nothing else.
2. Starts with a worked example, then a guided one, then independent ones.
3. Is achievable in {{minutes}} minutes.
4. Includes a "self-diagnosis" prompt at the end: rate your confidence 1-5 and note which part felt hardest.
5. Gives the answers for self-marking.

Output: the homework and the self-diagnosis box.
```

How to use: when you have a specific identified gap. Narrow, deliberate practice beats generic homework for fixing weaknesses.

Prompt 35. A "flipped" pre-reading / pre-work task

```
You are an expert tutor. Next lesson I want to teach {{topic}} to a {{level}} student in {{subject}}, using a flipped approach: the student prepares in advance and the lesson is spent applying, not introducing.

Create the pre-lesson task that:
1. Takes {{minutes}} minutes.
2. Introduces the CORE concept via a short, accessible medium: a 100-word reading, a link to a specific short video (2-4 min), or a simple worked example — pick {{format}}.
3. Includes 2-3 check questions that confirm the student actually engaged (not just skimmed).
4. Ends with a "bring a question" instruction — the student writes the one thing they found confusing.
5. Is realistic for this student to complete without me present.

Output: the pre-task as I'll send it, plus the check questions and answers.
```

How to use: to buy lesson time for practice and depth. The "bring a question" element means the lesson opens with the student's actual confusion, which makes the session immediately relevant.

Prompt 36. A homework that builds study skills (not just content)

```
You are an expert tutor. I want homework that develops the student's STUDY SKILLS as well as their subject knowledge. My {{level}} student in {{subject}} needs to improve {{skill_to_improve}} (e.g. note-taking, revision technique, time management, self-testing).

Create a homework task that:
1. Combines a small content task (on {{topic}}) with a specific study-skill technique.
2. Teaches the technique explicitly first — explain in 3-4 lines what the technique is and why it works.
3. Gives the student a structured way to apply it to the content.
4. Includes a short reflection: what did the technique add, and would you use it again?
5. Is achievable in {{minutes}} minutes.

Output: the combined worksheet (technique explanation + application + reflection).
```

How to use: for students whose problem is "how to study" more than "the subject". Especially valuable for GCSE/A-level students making the jump to independent study, and for adult learners returning to education.

Differentiation & SEN Support

Prompt 37. Adapt a lesson for a specific learning need

```
You are an expert in inclusive education and SEN support. I have a lesson on {{topic}} for a {{level}} class, originally designed for a typical {{level}} learner.

Adapt this lesson for a student who has {{need}} (e.g. dyslexia, ADHD, autism / ASD, dyscalculia, hearing impairment, English as an additional language, anxiety, slow processing speed).

For each part of the original lesson, give the adapted version and explain WHY the change helps this specific student. Cover at least:
1. How I present new information (visual / verbal / multisensory / chunked).
2. The length and complexity of instructions.
3. The type of practice tasks (and how I change the scaffolding).
4. How I check understanding (avoiding formats that penalise the need).
5. The homework.
6. How I manage time and transitions.

Be concrete and specific to {{need}} — not generic "provide support" advice. Output the a table: Original element | Adaptation | Why this helps.
```

How to use: when you have a student with a known, named need. The "why this helps" column is important — it keeps you informed rather than just doing what the AI suggests, and it lets you explain the choice to parents.

Prompt 38. Differentiate one task into three difficulty tiers

```
You are an expert tutor. I have a task in {{subject}} on {{topic}} at {{level}} level. The task is:

---TASK---
{{paste_the_task}}
---TASK---

Differentiate it into three tiers:
1. Support tier: for a student at {{support_level}} — reduce the cognitive load, give a worked
example, break it into steps, offer a word bank or formula sheet.
2. Core tier: for a student at the target level — the task as it should be for {{level}}.
3. Extension tier: for a student at {{extension_level}} — add a constraint, a requirement to
justify, a transfer to a new context, or an open-ended follow-up.

Keep the SAME underlying objective in all three tiers. Provide all three versions plus a note on
how to group or sequence them in a session.

Output: three clearly separated versions, then the sequencing note.
```

How to use: for mixed-level groups (Template 5) and for giving every student a task pitched right at their edge. Keep the objective constant so the whole group still shares the learning.

Prompt 39. Reduce cognitive load / simplify instructions

```
You are an expert in accessible instruction design. Here is an instruction or task I give my
student:

---INSTRUCTION---
{{paste_the_instruction}}
---INSTRUCTION---

Rewrite it to reduce cognitive load for a {{level}} student who {{difficulty}} (e.g. struggles with
working memory, multi-step instructions, or reading).

The rewrite must:
1. Use shorter sentences and plain vocabulary (reading age ~{{reading_age}}).
2. Break multi-step instructions into numbered single steps.
3. Put the KEY instruction first, and remove any non-essential detail.
4. Keep all the essential content — do not dumb it down, just make it clearer.
5. Add one visual or worked-example cue if it helps.

Output: the original, then the rewritten instruction, then a 2-line note on what I changed and why.
```

How to use: whenever a student's eyes glaze over at a paragraph-length instruction. A 30-second rewrite can be the difference between a task attempted and a task abandoned.

Prompt 40. Build a student profile for differentiation

```
You are an expert in creating learner profiles. Build a concise, useful profile for a student to guide differentiation.

Use this information about the student: {{student_info}} (include age/level, subject, strengths, weaknesses, SEN or needs if any, home language if different, goals, and motivation).

The profile must include:
1. A one-paragraph summary of the learner.
2. What works best for them (formats, pace, feedback style, incentives).
3. What to avoid (triggers, formats that fail, pace traps).
4. Their current level and next target in {{subject}}.
5. A "watch for" list — the first warning signs that a session is going wrong for them.
6. 3 differentiation strategies ready to deploy.

Formats it so I can keep it as a reference card, one page, in my notes.
```

How to use: once per student, usually at the start of your work together. Keep it in Notion and paste the relevant parts into prompts when you need differentiation that fits the individual.

Prompt 41. Adapt for English as an Additional Language (EAL)

```
You are an expert in teaching students who have English as an additional language. A {{level}} student in {{subject}} is an EAL learner at {{eal_level}} (e.g. beginner / intermediate / advanced in English). Today's lesson is on {{topic}}.

Adapt the lesson so the student can access the SUBJECT content while building their English. Specifically:
1. Pre-teach the key vocabulary for the topic — provide a mini glossary with clear, simple definitions and example sentences.
2. Rewrite the core explanation with simpler syntax, but keep the subject concepts intact.
3. Provide sentence stems / frames the student can use for answers and explanations.
4. Suggest ways for the student to demonstrate understanding that rely less on advanced English (diagrams, matching, labelling, ordering).
5. Flag the most likely sources of confusion — words that look similar, idioms, or technical terms with everyday homophones.

Output: the glossary, the rewritten explanation, the sentence stems, and the confusion flags.
```

How to use: for EAL students in any subject. The sentence stems are the single most practical item here — they let the student show subject knowledge without the extra barrier of constructing English from scratch.

Prompt 42. Plan for a student with short attention / high anxiety

```
You are an expert in supporting students with {{need}} (e.g. ADHD, short attention span, anxiety,
school avoidance). Design a {{duration}} session for a {{level}} student in {{subject}} on
{{topic}} that works WITH their attention and anxiety, not against them.

The session must:
1. Use shorter activity blocks ({{block_length}} minutes max) with clear transitions.
2. Include a movement / reset break at {{break_time}}.
3. Start with a predictable routine and state the session's shape out loud so the student knows
what's coming.
4. Build in one "safe to get wrong" moment — a low-stakes task before any judged one.
5. End with a clear, checkable summary so the student leaves with a sense of completion.
6. Include a calm-down or transition signal I can use when the student is spiralling.

Output: the session plan with timings, plus the transition signal and the routine script I can say
at the start.
```

How to use: for students whose barrier is attentional or emotional rather than intellectual. Predictability and chunking are the two big levers, and this template builds them in from the start.

Progress Reports & Parent Communication

Prompt 43. Weekly progress report for a parent

```
You are an expert tutor-coach. Write a {{tone}} weekly progress report for the parent/guardian of
{{student_name}}, who is a {{level}} student in {{subject}}.

This week we covered {{topics_this_week}}, and the student showed {{observations}} (e.g. strong
recall of X, struggled with Y). The plan for next week is {{next_week_plan}}.

The report should:
1. Start with a 2-line positive summary of the week.
2. State what we covered, clearly but not jargon-heavy.
3. Give a parent an assessment of progress: one clear sentence on what's improving, one on what
needs work.
4. Include a specific, concrete example of something the student did well (an actual moment or
piece of work).
5. State the ONE focus for next week, in plain language.
6. End with a short line inviting a question or a chat.
7. Be no longer than 150 words — parents skim.

Output: the report, ready to send.
```

How to use: the weekly parent email. Keep it short, concrete and positive-first; a 150-word report that names a real moment beats a 500-word generic one.

Prompt 44. Termly / end-of-term report

```
You are an expert tutor-coach. Write a full termly report for {{student_name}}, a {{level}} student in {{subject}}, for the term {{term}}.

The student started the term at {{starting_level}} and is now at {{current_level}}. Their target is {{target}}. Over the term we covered {{topics_covered}}. Their strengths are {{strengths}}; areas to develop are {{development_areas}}.

Produce a report with:
1. A summary paragraph (attainment, effort, attitude).
2. A "What we covered" section, organised by topic, with a one-line note on how the student did in each.
3. A "Strengths" section with 3-5 specific, evidenced points.
4. An "Areas to develop" section with 2-4 specific points, each with a suggested action.
5. A "Next steps" section: the concrete plan for next term.
6. A "How to help at home" section — 3 practical, simple things the parent can do.
7. A final encouraging paragraph.

Output the the full report, structured with headings, ready to adapt.
```

How to use: for end-of-term or exam-season reporting. The "how to help at home" section is what separates a report parents actually read from one they file away.

Prompt 45. A difficult or sensitive conversation (framing a problem)

```
You are an expert tutor-coach and a skilled, empathetic communicator. I need to tell {{parent_name}} (parent of {{student_name}}, a {{level}} student in {{subject}}) about a concern: {{the_concern}} (e.g. the student has lost motivation, has fallen behind, is avoiding a topic, or behaviour is slipping).

Draft a message that:
1. Opens with genuine, specific praise — a real recent positive observation, not a generic one.
2. States the concern factually and kindly, with the evidence I have, without blame or judgement of the student or the parent.
3. Explains that this is common and addressable — normalise it.
4. Proposes a specific, collaborative next step (a plan, a trial, an adjustment) and asks for the parent's input as a partner.
5. Ends on a hopeful, forward-looking note.
6. Is ready to send, and is no longer than 220 words.

Also give me a 3-bullet summary of how I should deliver this in person or on a call, so the written and verbal versions align.
```

How to use: for the hard conversations every tutor eventually has. The collaborative framing (you and the parent as a team) preserves the relationship and the student's confidence.

Prompt 46. Give parents concrete ways to support at home

```
You are an expert tutor-coach. The parent of {{student_name}} (a {{level}} student in {{subject}})
wants to help at home but doesn't know how. The student's current focus is {{current_focus}}; their
difficulty is {{difficulty}}.

Write a short guide for the parent that:
1. Explains in one or two sentences why home support matters and what its limits are (they are a
parent, not a teacher).
2. Gives 3-5 concrete, low-effort, realistic activities the parent can do — things that take 5-15
minutes and don't require subject expertise (e.g. asking the student to explain today's topic,
quizzing with flashcards, using everyday contexts).
3. For each activity, states exactly what the parent should do and what to listen/look for.
4. Tells the parent what NOT to do (e.g. don't re-teach, don't turn it into a test, don't do the
work for them).
5. Ends with a note on when to let the tutor handle it.

Output: a one-page parent guide, ready to send.
```

How to use: whenever a parent asks "what can I do?". A clear, bounded guide prevents the two failure modes — parents either hovering and doing the work, or doing nothing.

Prompt 47. Student self-assessment / self-report form

```
You are an expert tutor. Create a short, student-friendly self-assessment form for
{{student_name}}, a {{level}} student in {{subject}}, to fill in at the end of a session or week.

The form should be:
1. Very short — 5-8 quick items, mostly tick-boxes and one-line answers.
2. Written in language a {{level}} student will answer honestly (no big words, no judgement).
3. Cover: how confident I feel about today's topic (scale), what I found hardest, one thing I now
understand better, one thing I still want to work on, how I feel about the session (scale), and a
space for a question I was too shy to ask.
4. Include a note to the student explaining that honest answers help me teach them better.

Output: the form, ready to print or copy into an online tool.
```

How to use: at the end of a session (as a quick exit form) or weekly. The student's honest self-report is often more accurate than your observation — and asking for it builds their metacognition.

Prompt 48. Motivational / encouraging message for a student

```
You are an expert tutor and motivator. Write a short, genuine, encouraging message for
{{student_name}}, a {{level}} student in {{subject}}, who recently {{recent_event}} (e.g. did well
on a test, struggled with a topic, feels discouraged, has a big exam coming).

The message should:
1. Reference a SPECIFIC, real thing the student did (not generic "great job").
2. Connect that specific thing to the bigger picture of their progress.
3. Frame any struggle as a normal, useful part of learning — normalise it.
4. Give one concrete, simple next action.
5. Be warm but not gushing, and short (max 80 words).

Write two versions: one for a positive occasion and one for a tougher moment (I'll pick).
```

How to use: for the personal touches that keep students (and their parents) loyal. Specificity is everything — a message that names a real moment is worth ten that say "you're doing great".

Online & Distance Teaching

Prompt 49. Online whiteboard / shared-space lesson plan

```
You are an expert online tutor. Plan a {{duration}} online lesson for a {{level}} student in
{{subject}}, on {{topic}}, delivered via {{platform}} (e.g. Zoom/Google Meet + a digital whiteboard
like Jamboard, Miro, or an iPad).

The plan must adapt the lesson to the online medium:
1. Break the lesson into blocks that work online, with a clear "screen focus" for each block (share
screen, whiteboard, chat, or back to camera).
2. Include a warm start that checks audio/pen and reconnects the student.
3. Design the teaching so the student writes/interacts on the shared board, not just watches me.
4. Include a digital exit-check (a quick poll, a chat answer, or a question on the board).
5. Plan for what to do if the connection drops or the student's audio fails (a "roadblock plan").

Output: a table with Time | Block | Screen focus | What student does | What I do, plus the
roadblock plan.
```

How to use: whenever you teach online. The critical design shift is the screen-focus column and making the student interactive — the biggest failure of online lessons is the student becoming a passive viewer.

Prompt 50. Pre-recorded video / explanation script

```
You are an expert educator and scriptwriter. Write a script for a {{length}} video (or audio)
explanation of {{topic}} for a {{level}} student in {{subject}}.

The script must:
1. Open by connecting to what the student already knows ({{prior_knowledge}}).
2. Explain the key idea in plain, spoken language with one concrete example.
3. Include a "common misconception" moment where you flag the likely error and pre-empt it.
4. Use short sentences and natural speech rhythm — write it to be spoken, not read.
5. Include visual cues I can add on screen (what to show/shade/annotate at each point).
6. End with a single check question the student can pause and answer.

Output: the script with stage directions, timed roughly to my length.
```

How to use: for building a library of flipped videos, for students who miss sessions, and for revision material. Writing scripts ensures the explanation is tight and the visuals are planned.

Prompt 51. Homework / follow-up via messaging or LMS

```
You are an expert online tutor. I need to send {{student_name}} a clear, actionable homework
message after today's online session on {{topic}}.

Write a message (short, WhatsApp/Teams/LMS-friendly) that:
1. Opens with a warm one-line acknowledgment of today's session.
2. States the homework clearly: what to do, how long it should take ({{minutes}} minutes), and the
deliverable.
3. Includes the retrieval question from today (so they can start immediately).
4. Provides a "if you get stuck" instruction.
5. Sets the expectation for next session (what they should bring).
6. Uses a friendly, low-pressure tone.

Output: the message, ready to copy and send. Also give a 2-line version if the platform only allows
very short messages.
```

How to use: the glue between online sessions. A clear follow-up message does more to keep momentum than the session itself.

Prompt 52. A synchronous/asynchronous blended session plan

```
You are an expert instructional designer. I teach {{subject}} to a {{level}} student in a blended setup: {{synchronous_asynchronous_split}} (e.g. 30 min live online + independent work between).

Design a blended session plan on {{topic}}:
1. Identify what should be ASYNCHRONOUS (done by the student on their own, before/after the live part) — choose the parts that don't need me: pre-reading, low-stakes recall, simple drills, video watching.
2. Identify what should be SYNCHRONOUS (live, with me) — choose the parts that genuinely need interaction: troubleshooting, discussion, feedback, guided practice.
3. Structure the flow: asynchronous-prep → live session → asynchronous-follow-up, with clear timings.
4. Provide the instructions for each asynchronous task so the student knows exactly what to do on their own.

Output: the blended plan with the async/live/async structure, timings, and the async task instructions.
```

How to use: for students who get a limited live slot but need more work around it. Getting the async/live split right (put the interactive stuff live, the drill work async) is the whole game.

Prompt 53. Build your reusable teaching brief / house style

```
You are an expert in creating reusable teaching documents. Help me build a "Teaching Brief" — a one-page document I paste at the top of prompts so every AI output matches my approach.

Create a template with fields for:
1. My teaching context: subjects, levels, formats (1-to-1 / groups / online).
2. Curriculum & exam board: e.g. {{exam}}, specification refs, exam structure.
3. My students: typical level, common difficulties, home language / SEN notes.
4. My style: tone, emphasis (e.g. "I value understanding over memorising", "show your working"), preferred feedback style.
5. My house formatting: how I like tables, headings, and materials laid out.
6. A "never" list: things I don't want in outputs (e.g. generic praise, unsupported claims, worksheets that can't be printed, gimmicky games).

Then give me a completed SAMPLE brief for my subject {{subject}} based on the information I've told you: {{my_info}}. I can then edit it.

Output: the blank template and the sample.
```

How to use: do this once, and it upgrades every prompt in this pack. Paste the filled brief at the top of any prompt so the AI knows your curriculum, your students and your house style from the start.

Lesson Reflection & Improvement

Prompt 54. Post-lesson self-reflection

```
You are a reflective teaching coach. I just taught a {{subject}} lesson on {{topic}} to a
{{student_or_class}} ({{level}}).

Here is what I observed: {{what_happened}} (e.g. the student grasped X quickly, struggled with Y,
ran out of time on Z, seemed disengaged in the middle).

Help me reflect:
1. Ask me up to 5 sharp questions to help me reflect on what actually happened, what the student
learned, and where my teaching choices helped or hindered. (Ask them one at a time; I'll answer.)
2. After I answer, summarise the key insight and give me ONE concrete change to make next time.
3. Suggest one thing to try differently in the next session.
```

How to use: a genuinely reflective habit — run this after your most puzzling or most satisfying sessions. The one-at-a-time questioning forces a real reflection instead of a shallow description.

Prompt 55. Analyse a session recording or notes

```
You are an expert teaching analyst. Here are my notes / a transcript / a description of a lesson I
just gave:

---LESSON---
{{paste_notes_or_transcript_sharing}}
---LESSON---

Analyse it and:
1. Summarise what the lesson covered and what the student actually did (not what I planned).
2. Identify the moments where learning most likely happened, with the evidence from the notes (a
correct insight, a "get it" moment).
3. Identify the moments where learning most likely did NOT happen, with evidence (silence, an error
that wasn't corrected, a task skipped).
4. Match what happened against the lesson's objective and flag whether the objective was met.
5. Give me THREE specific, actionable improvements for the next session, ordered by impact.

Output: the analysis in clear sections, then the three improvements.
```

How to use: after a session you feel you misread, or when a student plateaued. The evidence-based framing (what *actually* happened vs what you planned) is the value.

Prompt 56. Build a student error log / keep a record

```
You are an expert tutor-coach. Create a reusable error-log template for tracking a {{level}}
student's recurring mistakes in {{subject}}.

The log should track, per entry:
1. Date.
2. Topic.
3. The error (what the student did wrong, quoted from their work).
4. The likely cause (knowledge gap / technique / careless / misread / time pressure).
5. The fix applied (what we did about it).
6. Whether it reappeared later (yes/no, date).

Also give me:
- A "most common errors" summary layout I can fill in after 3-4 weeks to spot patterns.
- A rule for when an error is "resolved" (e.g. correct on three consecutive independent attempts).
- A brief note on how to use this log in parent reports (the log is evidence).

Output: the log template, the summary layout, the resolution rule, and the parent-report note.
```

How to use: keep one log per student. It turns your memory into an evidence trail — and it's the raw material for the best progress reports and for spotting whether a fix actually held.

Prompt 57. Plan the "next lesson" from an exit ticket

```
You are an expert tutor. Here are the results of an exit-ticket / quick check from a recent
{{subject}} lesson on {{topic}} ({{level}}):

---RESULTS---
{{paste_the_exit_ticket_results}}
---RESULTS---

Based on these results:
1. Tell me how many students met the objective (if this is a group) or whether this single student
has met it.
2. List the specific things that are NOT yet secure, in order of how much they block progress.
3. Recommend the focus for the NEXT lesson: what to reteach, what to practice, what to move on to.
4. Design the first 10 minutes of that next lesson (the retrieval + the gap-fill) that directly
addresses the biggest gap.
5. Flag anything in the results that surprises you or suggests a deeper problem.

Output: the assessment, the recommended next-lesson focus, and the first-10-minutes plan.
```

How to use: the most efficient planning loop: end one lesson → plan the next from the evidence. This closes the loop your exit tickets create.

Prompt 58. Get feedback from the student

```
You are an expert tutor. I want honest feedback from {{student_name}}, a {{level}} student in
{{subject}}, after our recent sessions on {{topic}}.

Create a short feedback prompt that:
1. Uses a format that makes honesty safe and easy (rating scale + short open questions, anonymous
if I choose).
2. Asks about: how clear my explanations were, whether the pace was right, what was most/least
useful, how confident they feel now, and one thing they'd change.
3. Includes a "no wrong answers" framing that lowers the barrier to real feedback.
4. Ends with a one-line thank-you that acknowledges I'll act on it.
5. Is short enough to complete in under 3 minutes.

Output: the feedback form. Also give me a 2-line script for verbally inviting feedback, for
students reluctant to write it.
```

How to use: run this every few sessions with a student you want to retain and serve well. Honest feedback is the fastest route to a bespoke service — and students remember the tutor who asked and then acted.

One Lesson, End to End — a worked 60-minute maths example

Theory is easier than practice, so here is one complete lesson built purely from this pack. It shows the actual prompt choices, the actual placeholder-filling, and the actual output at each step — then the final lesson. The example is maths (linear equations, KS4/GCSE level) but the *process* is identical for any subject.

The scenario: I have a single GCSE student, Amy, working at a grade 4 (of 9). She can solve simple two-step equations (`3x + 2 = 11`) but keeps dropping terms when the unknown appears on both sides (`5x − 3 = 2x + 9`). I have a 60-minute 1-to-1 session. Her target is grade 5.

Step 0 — I set my teaching brief

I keep a one-page brief for Amy (built with Prompt 53). Key lines:

- Level: GCSE Maths, currently grade 4, targeting grade 5.
- Difficulty: drops terms when the unknown is on both sides; also mixes up the order of inverse operations.
- Style: value understanding over memorising; I want her to "check by substituting back".
- Never: generic praise, unsupported claims, worksheets that can't be printed.

Step 1 — I pick a template

I choose **Template 3 (1-to-1 tutoring session)** — it's a single student, 60 minutes, a known specific gap. That gives me the armature: Connect → Precise target → Teach + go deep → Application → Consolidation → Set next.

Step 2 — I diagnose the real gap

Instead of trusting my assumption, I run **Prompt 12 (diagnostic)** with Amy for 5 minutes. She answers 5 quick questions. Result: she solves `5x − 3 = 2x + 9` and *does* collect the `x` terms correctly when they're collected to the left, but she writes `2x + 9 − 2x = 5x − 3` and then cancels the wrong way. The real gap is **collecting like**

terms correctly on the correct side and preserving the equation's balance — not what I assumed. The lesson now has a sharper target.

Step 3 — I write the objective

Using **Prompt 8 (learning objectives)**, I settle on:

> **Objective:** By the end of the session, Amy will solve linear equations with the unknown on both sides by collecting like terms onto one side and applying inverse operations in the correct order, checking her answer by substitution, to 100% accuracy on 4 consecutive independent attempts.
>
> **Say-aloud sentence:** "By the end of today you'll be able to solve any equation where the letter is on both sides — and you'll know you're right because you can check it."

Step 4 — I generate the lesson content

I feed **Prompt 1 (complete lesson plan)** with my filled-in specifics: subject = maths, level = GCSE, topic = linear equations with unknown on both sides, duration = 60 min, student = Amy, current level = grade 4 (weak on like-terms collection), target = grade 5, differentiation note = "needs a visual balance model and step-by-step scaffolding".

The AI returns a structured plan. I *verify its maths* — every equation balances, every inverse step is correct — and I tighten the timing to the diagnostic I already ran. Here is the refined plan:

Time	Phase	What I do	What Amy does
00–05	Connect + recall	Check homework; ask "what was the rule for two-step equations?"	Answers; reveals she's more confident than last week
05–10	Precise target	Write today's objective + the say-aloud sentence on the board	Reads it back; nods; says "I keep messing up the letters"
10–18	Teach — the balance model	Use a simple balance/scale analogy. Show `5x − 3 = 2x + 9` on the scale; physically "remove" `2x` from both sides, then show why we subtract 2x from *both* sides. Model one worked example aloud, narrating every step	Watches; answers "what happens to the scale if I take 2x off only one side?"
18–32	Guided practice (we do)	Two problems together. Amy says each step; I only prompt, don't do it. We write both a correct and an "I accidentally..." version and compare	Solves two equations aloud, narrating the balance step
32–45	Application (she does)	Three independent problems, increasing difficulty, including one with `x` appearing as a negative coefficient	Solves them. I watch her process, not just answers
45–52	Consolidation	Amy writes the rule in her own words (3 lines) and solves one final problem completely alone	Writes the rule and solves the final check problem
52–60	Set next	We mark the final problem together; she checks by substitution. Agree homework (Prompt 32) and the error-log entry (Prompt 56)	Substitutes her answer back in; confirms it works; agrees to log the "dropping terms" slip if it reappears

Step 5 — I generate the supporting materials

- **Practice set** (Prompt 15 scaffolded, and Prompt 16 independent): I get a 5-problem set with model answers, hints and a "challenge" final problem. I check every answer.

- **Exit ticket** (Prompt 21): three questions — core recon (solve one equation), the misconception check (a distractor that tests whether she's still dropping terms), and a transfer question (the same idea in a word problem). I'll run this in the last minute.
- **Homework** (Prompt 32): a 15-minute consolidation set with a retrieval question from last week's topic (expanding brackets) and a gentle pre-exposure to next week's topic (forming equations from word problems).
- **Error-log entry** (Prompt 56): I log the "dropping terms" error with the balance-model fix, so I can check in three weeks whether it has resolved.

Step 6 — I reflect and set next

The exit ticket tells me whether the objective landed. If the misconception check still shows dropped terms, the next session starts with Prompt 6 (a single-misconception lesson) before moving on. The "set next" phase fixes the homework and names next week's target. I write a 3-line progress note for Amy's parent (Prompt 43 format) and file it.

What the whole flow saved

Creating this lesson from scratch would normally take me ~45–60 minutes of typing, formatting and second-guessing. With the pack, the *generation* took ~5 minutes across the prompts; the rest of my time went to the two things only I can do — checking the maths and coaching Amy. That is the point of the pack: the AI does the drafting, you do the teaching.

Subject Starter Prompts — six one-liners to copy instantly

These are quick, high-value prompts to fire off when you have a topic but no time. Each is one line — fill the few `{{placeholders}}`, paste, and you have a lesson skeleton in seconds.

1. **Maths (GCSE level)** — "You are a GCSE maths tutor. Write a 45-minute lesson plan for {{gra}} on {{topic}}, differentiated for a student working at grade {{grade}}, including a starter, worked examples, guided practice with a mark scheme, and an exit ticket."
2. **Science (KS3/KS4)** — "You are a science tutor. Plan a 50-minute lesson on {{topic}} for a {{level}} student, with a hands-on demonstration or simple experiment idea, a clear explanation of the underlying concept, three practice questions, and a homework task using everyday materials."
3. **English literature (GCSE/A-level)** — "You are an English tutor. Design a lesson on {{text}} for a {{level}} student: focus on {{theme_or_quote}}, with a guided close-reading task, an argument-building activity using a 'point-evidence-analysis' frame, and a practice essay paragraph with a model answer."
4. **History (GCSE/A-level)** — "You are a history tutor. Create a {{duration}} lesson on {{event_or_period}} for a {{level}} student, built around two contrasting sources, a 'how useful is this source' analysis frame, a debate or interpretation activity, and an exam-style question with a mark scheme."
5. **Languages (any level, e.g. French/Spanish)** — "You are a language tutor. Write a conversation-focused lesson on {{topic}} for a {{level}} learner, including key vocabulary with example sentences, a role-play or speaking task with sentence starters, a listening/reading comprehension, and a short writing or speaking homework."

6. **Coding (adult beginner / GCSE CS)** — "You are a coding tutor. Plan a hands-on lesson on {{concept}} (e.g. loops, functions, variables) for a {{level}} learner, with a starter reviewing the previous concept, a step-by-step code-along, a small bug-fixing task, a challenge exercise, and a mini-project homework they can complete alone."

Every one of these can be pasted directly into your AI tool of choice — and if you want them upsized into a full lesson, just add "expand into a full lesson plan with timings" as a final line.

FAQ

Do I need to be a prompt-engineering expert to use this?
No. Every prompt is written to work as-is. Your only job is to fill in the `{{placeholders}}` (or write `UNKNOWN` where you're not sure) and paste. If an output is nearly right, just ask for a tweak — "keep the structure, but make the examples easier" — rather than rewriting the prompt.

I don't teach UK levels (KS3/GCSE/A-level). Will this still work?
Yes. Levels appear only as variables. The mapping table in "How to use this pack" shows how "differentiation" changes by stage, and every prompt works for US grades, IB, university courses, adult learners, professional exam prep and more. Swap `{{level}}` for whatever your context is.

Which AI tools does this work with?
Any modern chat-based AI that accepts detailed prompts — ChatGPT, Claude, Gemini, and similar. The prompts are tool-agnostic. Best results come from tools that handle long, structured instructions well.

How is this different from just asking an AI to "write a lesson plan"?
Three ways. (1) The prompts set a role, audience, constraints and output format, so results are consistently structured and usable. (2) They include the checks that matter — misconceptions, verification of facts, error analysis, differentiation — that a bare "write a lesson plan" prompt forgets. (3) They're pre-tested against the realities tutors actually face, built around the 10 templates and the end-to-end worked example.

Will the AI's content be accurate enough to teach?
Not automatically — and that's true of any AI-generated content. That's why every category ends with guidance and the pack repeatedly tells you to verify the specific claims (equations, dates, quotes) and to use the "list every factual claim to verify" step. You remain the professional; the AI is a very fast assistant.

Is this really 50+ prompts?
Yes — the pack contains 58 numbered prompts across 10 categories, plus the 10 lesson templates, the worked example, subject starters and FAQ. It comfortably exceeds the advertised "50+ prompts."

How do the PDF and Notion formats work?
You receive both. The PDF is for reading offline and printing the sections you use most. The Notion version imports the whole pack as clean, editable pages (one page per prompt), so you can fill prompts in place, keep a database of lessons, and build your own library over time.

What if a prompt doesn't fit my exact student?
Fill in the placeholders honestly, and if a specific detail is missing, add it as an extra instruction at the end. The prompts are skeletons designed to be bent. The differentiation and SEN prompts in particular are built to be adapted per student.

Free Lifetime Updates — every future version is yours

This pack will keep improving, and you'll get every future version automatically at no extra cost. As AI tools evolve, as new teaching techniques emerge, and as buyers like you send feedback on what works, this pack will be updated — new prompts, refined templates, new worked examples, new subject coverage. When you buy, you own the full current edition and every edition after it, free, for life.

If you'd like to suggest a prompt or a template (or report a specific tutor scenario the pack doesn't yet cover), send it in — the updates are built from what working tutors actually need.

Now go build a lesson in five minutes.
